Scale-Out NAS is a type of storage architecture that uses multiple nodes to store data. Each node is a server with its own storage and network interface. The nodes are connected to a central controller that manages the data and provides a single point of access for clients. This architecture allows for high capacity and scalability, as more nodes can be added to increase storage and performance. It is commonly used in enterprise environments for backup and archive storage.

Which of the following is a characteristic of Scale-Out NAS?

- A. It uses a single controller to manage all data.
- B. It uses a single controller to manage all data and provides a single point of access for clients.
- C. It uses multiple nodes to store data and provides a single point of access for clients.
- D. It uses multiple nodes to store data and provides a single point of access for clients.
