Lift and shift

In a lift and shift migration, you move workloads from a source environment to a target environment with minor or no modifications or refactoring. The modifications you apply to the workloads to migrate are only the minimum changes you need to make in order for the workloads to operate in the target environment.

A lift and shift migration is ideal when a workload can operate as-is in the target environment, or when there is little or no business need for change. This migration is the type that requires the least amount of time because the amount of refactoring is kept to a minimum.

There might be technical issues that force a lift and shift migration. If you cannot refactor a workload to migrate and cannot decommission the workload, you must use a lift and shift migration. For example, it can be difficult or impossible to modify the source code of the workload, or the build process isn't straightforward so producing new artifacts after refactoring the source code might not be possible.

Lift and shift migrations are the easiest to perform because your team can continue to use the same set of tools and skills that they were using before. These migrations also support off-the-shelf software. Because you migrate existing workloads with minimal refactoring, lift and shift migrations tend to be the quickest, compared to improve and move or remove and replace migrations.

On the other hand, the results of a lift and shift migration are non-cloud-native workloads running in the target environment. These workloads don't take full advantage of cloud platform features, such as horizontal scalability, fine-grained pricing, and highly managed services.

Available audit logs

The following types of audit logs are available for Cloud Storage:

- Admin Activity audit logs: Entries for `ADMIN_WRITE` operations that modify the configuration or metadata of a Cloud project, bucket, or object. You can't disable Admin Activity audit logs.
- Data Access audit logs: Entries for operations that modify objects or read a Cloud project, bucket, or object. There are several sub-types of Data Access audit logs:
  - `ADMIN_READ`: Entries for operations that read the configuration or metadata of a Cloud project, bucket, or object.
  - `DATA_READ`: Entries for operations that read an object.
  - `DATA_WRITE`: Entries for operations that create or modify an object.

To receive Data Access audit logs, you must explicitly enable them.

For fuller descriptions of the audit log types, see Types of audit logs.

**NEW QUESTION: 61**
□□□ □□ □ VPC□ □□□□□□□ □□□□ □□ □□□□ □□□□ □□□ □□□□ □□□ □□□ □□ □□□□ □□□ □□□ □□□□ □□□□. □□□ □□□ □□□□□ □□ □□ □ □ □□□ □□□□□ □□□□ □□□. □□ □ □□□ □□□ □□□□□?
**A.** □□ □□□ □□□□ □□ □□□□(1000) □□□ □□□ □□□ □□□□ □□ □□□□ (65534) □□□ □□□□□.
**B.** □□ □□□ □□□□ □□ □□□□(65534) □□□ □□□ □□□ □□□□ □□ □□□□ □ □(1000)□ □□□□□.
**C.** □□□ □□□ □□□□□ □□ □□□□(1000) □□□ □□□□□.

**D.** □□ □□□ □□ □□□ □□ □□□ □□□□ □□ □□□□(1000) □□□ □□□□□.
**Answer: (SHOW ANSWER)**
□□□ □□ □□ VPC □□□□□□ □ □□ □□□ □□□ □□□ □□□□. □□ □□□ □□□ □□ Cloud Console□□ □□□□ □□□□.
□□□□ □□ □□ □□□□□. □□□ □□□□ □□□ 0.0.0.0/0□□ □□□□□ □□ □□ (65535) □□□□ □□□ □□□□ □□ □□□□□ GCP□□ □□□ □□□□ □□□□ □□ □ □□□ □□□□ □□ □ □□□□. □□□□□ □□ □□□ □□□ □□□□□ □□□□ □□□ □ □□□□. □□□□□ □□□□ □□□□ □□ □□□ □□□ □□ □□□□□ □□ IP □□□ □□□ Cloud NAT □□□□□ □□□□ □□ □□□ □□□□ □□□□□. □□□ □□□ □□□ □□□ □□ □□□ □□□□□.

If IPv6 is enabled, the VPC network also has these two implied rules:

- **Implied IPv6 allow egress rule.** An egress rule whose action is `allow`, destination is `::/0`, and priority is the lowest possible ( `65535` ) lets any instance send traffic to any destination, except for traffic blocked by Google Cloud. A higher priority firewall rule may restrict outbound access. Internet access is allowed if no other firewall rules deny outbound traffic and if the instance has an external IP address.
- **Implied IPv6 deny ingress rule.** An ingress rule whose action is `deny`, source is `::/0`, and priority is the lowest possible ( `65535` ) protects all instances by blocking incoming connections to them. A higher priority rule might allow incoming access.

The implied rules *cannot* be removed, but they have the lowest possible priorities. You can create rules that override them as long as your rules have higher priorities (priority numbers *less than* `65535` ). Because `deny` rules take precedence over `allow` rules of the same priority, an ingress `allow` rule with a priority of `65535` never takes effect.

# Automatically apply VM configuration updates in a MIG

Send feedback

This document describes how to automatically apply configuration updates to the virtual machine (VM) instances in a managed instance group (MIG).

Compute Engine maintains the VMs in a MIG based on the configuration that you specify in an instance template and optional stateful configuration. From time to time, you might want to update this configuration.

When you set up an automated update, the MIG rolls out a new version of an instance template automatically to all or to a subset of the group's VMs. If you have stateful configuration, the MIG also applies any unapplied per-instance configurations to the corresponding VMs.

You can control the speed of deployment, the level of disruption to your service, and, by using a canary update, the number of instances that the MIG updates with the new template. After you specify a new configuration, you do not need to provide additional input and the update completes on its own.

Alternatively, if you want to selectively apply a new configuration only to new or to specific instances in a MIG, see Selectively updating instances in a MIG. To help you decide, see Choosing between automated and selective updates.

## Starting a basic rolling update

A basic rolling update is an update that is gradually applied to all instances in a MIG until all instances have been updated to the latest intended configuration. The rolling update automatically skips instances that are already in their latest configuration.

You can control various aspects of a rolling update, such as how many instances can be taken offline for the update, how long to wait between updating instances, whether the new template affects all or just a portion of instances, and so on.

Here are things to keep in mind when making a rolling update:

- **Updates are intent based.** When you make the initial update request, the Compute Engine API returns a successful response to confirm that the request is valid, but that doesn't indicate that the update succeeded. You must check the status of the group to determine whether your update was deployed successfully.
- **The Instance Group Updater API is a declarative API.** The API expects a request to specify the desired post-update configuration of the MIG, rather than an explicit function call.
- **Automated updates support up to two instance template versions in your MIG.** This means that you can specify two different instance template versions for your group, which is useful for performing canary updates.

To start a basic rolling update where the update is applied to all instances in the group, follow the instructions below.

□□
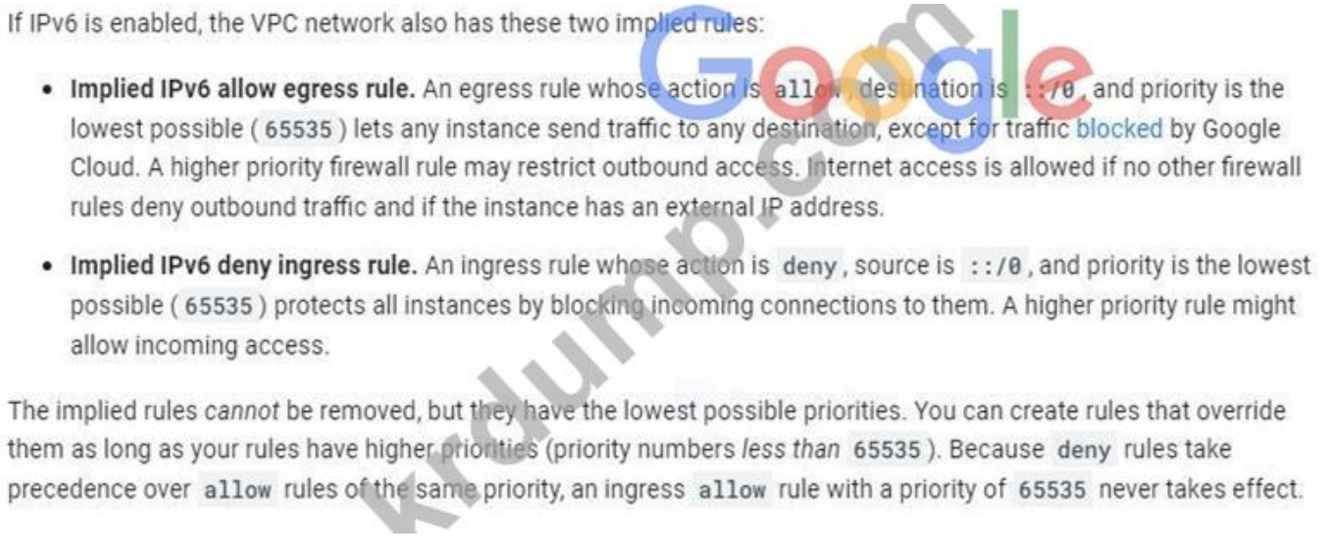
□□□ □□ □□ VPC □□□□□□ □ □□ □□□ □□□ □□□ □□□□. □□ □□□ □□□ □□ Cloud Console□□ □□□□ □□□□.
□□□□ □□ □□ □□□□□. □□□ □□□□ □□□ 0.0.0.0/0□□ □□□□□ □□ □□ (65535) □□□□ □□□ □□□□ □□ □□□□□ GCP□□ □□□ □□□□ □□□□ □□ □ □□□ □□□□ □□ □ □□□□. □□□□□ □□ □□□ □□□ □□□□□ □□□□ □□□ □ □□□□. □□□□□ □□□□ □□□□ □□ □□□ □□□ □□ □□□□□ □□ IP □□□ □□□ Cloud NAT □□□□□ □□□□ □□ □□□ □□□□ □□□□□. □□□ □□□ □□□ □□□ □□ □□□ □□□□□.



If IPv6 is enabled, the VPC network also has these two implied rules:

- **Implied IPv6 allow egress rule.** An egress rule whose action is `allow`, destination is `::/0`, and priority is the lowest possible ( `65535` ) lets any instance send traffic to any destination, except for traffic blocked by Google Cloud. A higher priority firewall rule may restrict outbound access. Internet access is allowed if no other firewall rules deny outbound traffic and if the instance has an external IP address.
- **Implied IPv6 deny ingress rule.** An ingress rule whose action is `deny`, source is `::/0`, and priority is the lowest possible ( `65535` ) protects all instances by blocking incoming connections to them. A higher priority rule might allow incoming access.

The implied rules *cannot* be removed, but they have the lowest possible priorities. You can create rules that override them as long as your rules have higher priorities (priority numbers *less than* `65535` ). Because `deny` rules take precedence over `allow` rules of the same priority, an ingress `allow` rule with a priority of `65535` never takes effect.

□□□ □□□ □□□□□, □□□ □□□ □□□□ □□□

A project organizes all your Google Cloud resources. A project consists of a set of users; a set of APIs; and billing, authentication, and monitoring settings for those APIs. So, for example, all of your Cloud Storage buckets and objects, along with user permissions for accessing them, reside in a project. You can have one project, or you can create multiple projects and use them to organize your Google Cloud resources, including your Cloud Storage data, into logical groups.
