**NEW QUESTION: 4**

Which of the following is a benefit of using App-ID for application identification?

- A. DNS resolution is used to identify applications.
- B. App-ID can identify applications based on their IP addresses.
- C. DNS resolution is used to identify applications.
- D. App-ID can identify applications based on their IP addresses.

**Answer: B (LEAVE A REPLY)**

App-ID can identify applications based on their IP addresses. Palo Alto Networks App-ID uses a variety of methods to identify applications, including IP addresses, ports, protocols, and signatures. App-ID can identify applications based on their IP addresses, ports, protocols, and signatures.

App-ID can identify applications based on their IP addresses.

\* A: DNS resolution is used to identify applications. DNS resolution is used to identify applications. DNS resolution is used to identify applications.

\* B: App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses.

\* C: DNS resolution is used to identify applications. DNS resolution is used to identify applications. DNS resolution is used to identify applications. DNS resolution is used to identify applications.

\* D: App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses. App-ID can identify applications based on their IP addresses.

App-ID can identify applications based on their IP addresses:

□□□ SIEM □□□□□□ Advanced Threat Prevention □□ □□□□ □□□□□. □□□□ □□□□ □□□□□ Advanced Threat Prevention □□□□ □□□□□□ □□□ □□ □□□□ □ □□□ □□ □□□□ □□□□□□ □□ □□□□□□.

A. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

B. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents. Advanced Threat Prevention (ATP) is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware.

C. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

D. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents. ATP is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware.

**Answer: (SHOW ANSWER)**

\* SIEM:

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* ATP is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware.

\* SIEM:

\* ATP:

\* Advanced Threat Prevention (ATP) is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* Palo Alto Networks is a leading provider of network security solutions, including SIEM and ATP.

\* SIEM > SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* "SIEM" is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* SIEM > SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents. Syslog is a standard protocol for sending log messages to a central log server.

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents?

\* A(SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents):

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* B (SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents):

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents, ATP is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware.

\* C (SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents):

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

Palo Alto Networks is a leading provider of network security solutions, including SIEM and ATP:

\* SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

\* ATP is a security technology that helps organizations detect and prevent advanced threats, such as zero-day attacks and malware.

## NEW QUESTION: 12

SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents. SIEM is a collection of tools and processes that help organizations monitor and analyze their network and system logs for signs of security incidents.

Which of the following is a common method for detecting malware?

- A. File hashing
- B. ID-based detection
- C. DNS filtering
- D. URL filtering

Answer: (SHOW ANSWER)

\* DNS filtering (C):

\* DNS filtering blocks 53rd port traffic to prevent malware communication.

\* DNS filtering blocks traffic to DNS servers that host malware, such as C2 servers.

\* DNS filtering blocks traffic to DNS servers that host malware, such as malware distribution servers.

\* NGFW blocks traffic to DNS servers that host malware, such as malware distribution servers.

\* File hashing (A):

\* File hashing compares file hashes to a known good baseline, such as 53rd port DNS traffic to C2 servers.

\* App-ID (B):

\* App-ID identifies applications, DLP (Data Loss Prevention) identifies sensitive data, and DNS filtering blocks traffic to DNS servers that host malware.

\* URL filtering (D):

\* URL filtering blocks traffic to URLs that host malware, such as DNS servers that host malware.

Palo Alto Networks NGFW:

\* DNS filtering

### NEW QUESTION: 13

Which NGFW feature is used to detect malware (SE) on a Zero Trust network?

- A. "PDF > PDF" rule on Zero Trust network.
- B. "PDF > PDF" rule on Zero Trust network.
- C. NGFW Zero Trust network.
- D. "ACC" rule on NGFW network.
